Apple Developer Academy 2027

Project Concept

Obatku is a mobile application designed to help users manage their medication schedules more effectively, especially for people who often forget to take their medicines on time. The core feature of the application is a smart medicine reminder system that allows users to add their medications, configure reminder schedules, and receive timely notifications to ensure consistent medicine intake. The idea for developing Obatku came from a personal experience. I created this application to help my father manage his medicines more easily, as keeping track of multiple medications and schedules can often be challenging.

Role

Mobile Developer

Link

Website : <https://www.obatkuapp.my.id/>

Challenges

One of the biggest challenges while developing Obatku was building the app using a multiplatform technology for both Android and iOS. I had to handle platform-specific behaviors such as notifications, background reminders, permissions, and local storage, since each platform works differently. Ensuring a consistent user experience and maintaining compatibility across both platforms were also key challenges during development.

How to solve

To solve the multiplatform challenges in Obatku, I separated the shared business logic from platform-specific implementations. I reused common code for features such as medicine management, scheduling, and data handling, while implementing native-specific solutions for notifications, permissions, and background services on Android and iOS.

ECOMMERCE

PORTOFOLIO 1 | YEAR 2023

Project Concept

This is E-commerce based on android application, build using Kotlin language with several key features including displaying a list of products, adding items to the cart and wishlist, performing checkout, and conducting payment transactions all within a single Android application. I created this project with a strong intent to enhance my skills and gain a deeper understanding of Android Architecture Components. This project reflects my dedication to learning and applying the latest technologies in mobile application development.

Role

Mobile Developer

Link

Repository : <https://github.com/farischamakay/Ecommerce.git>

Challenges

Ensuring the application runs smoothly, with quick load times and responsive interactions, can be challenging, especially as the number of products and users increases. This involves optimizing the app's performance, managing memory usage, and reducing latency.

How to solve

Profile the app using Android Studio's profiler tools to identify performance bottlenecks. Optimize image loading with libraries like Glide or Picasso. Use RecyclerView for efficient list rendering. Implement pagination for loading large datasets. Minimize memory leaks by using weak references and clearing resources when they are no longer needed.

Apple Developer Academy 2027

Project Concept

This is a demo of my final project in college. This program is an implementation of a recommendation system using content-based filtering for a cookbook mobile application. I created this program using the Dart programming language for the frontend, and Python for the backend. With this project, I aimed to not only showcase my technical skills but also to inspire others to explore the endless possibilities at the intersection of food and technology.

Role

Mobile Developer

Repository : <https://github.com/farischamakay/Final-project-recipe-recommendation.git>

Challenges

Integrating a seamless user interface with a robust and efficient backend poses technical challenges and also for efficiently managing and storing large food datasets requires proper storage and indexing strategies. Optimizing database queries and reducing latency in data retrieval are additional challenges.

How to solve

Utilize database indexing and caching techniques to optimize data retrieval, using NoSQL databases for flexible and scalable data storage. Implement data compression techniques to reduce storage requirements.

Apple Developer Academy 2027

Project Concept

This is the capstone project that I created with my friends when I joined Bangkit Academy 2022. This idea started with concerns about home security, especially when doing activities outside the home. In this project, we made a smart surveillance camera by utilizing deep learning where if objects are detected entering a certain area, the camera will immediately send a notification to the users so that the users can be on guard if something unwanted happens in their house.

Challenges

Working with a team for the first time can present challenges related to communication, coordination, and resolving conflicts or differences in opinions.

How to solve

We establish clear communication channels and guidelines for sharing updates, progress, and feedback. Scheduled regular team meetings to discuss project goals, tasks, and timelines. Foster a culture of open communication, mutual respect, and constructive feedback within the team and encourage active participation and collaboration by assigning roles and responsibilities.
